

Review of: "Using Taxes to Attract the Creative Class in the Presence of a Region-Specific Rent"

Natalia Iershova

Potential competing interests: No potential competing interests to declare.

An important aspect of the growth of the region's economy is the attraction of representatives of the creative class. It has been proven that entrepreneurship contributes to the formation of a competitive environment, mobile responds to changes in the situation in the consumer market of the regions, and has a positive effect on the level of employment of the population. Therefore, for those who are interested in the topic of increasing the competitiveness of regions, it will be useful to get acquainted with the use of taxes to attract the creative class in the presence of regional rent.

I see an interesting approach that shed light on the question: What will be the profit of an entrepreneur in two regions for two possible values of rent for a particular location?

This issue will be relevant if the usefulness of tax policy for attracting the entrepreneurial creative class is proven. This is due to the ability of regions to use local public goods. Such benefits vary depending on the territory.

Game-theoretic models are a relevant tool for conducting this research.

I assume that there are differences between entrepreneurial activity depending on the field of activity. Therefore, I agree that the phrase "creative economy" is used. This determines the desire of the creative class to generate new ideas, critical evaluation of these new ideas.

I think further research by the authors in the direction of the analysis of "creative clusters" will be interesting. After all, such clusters create a single space that allows you to unite people of creative professions and entrepreneurs, exchange ideas, which strengthens their potential and contributes to the further development of the system.
