

Review of: "Sectoral GDP and Tax Revenue: a Panel Data Analysis"

Martha Méndez

Potential competing interests: No potential competing interests to declare.

The article presents a very interesting and relevant topic, however, an effort is required to clarify some aspects, for example, to clarify the significance of the study in terms of public policies or government actions to take advantage of this information, can this positive or negative correlation support government decisions, can it generate public policies that increase tax collection, what is the result of the Hausman test, how can the informal economy be less likely to operate in the sector, how can the informal economy be less likely to operate in the sector?

On the other hand, a relevant theoretical review is not presented, why is this? is there not enough literature to support this study? which I believe is not the case, therefore I encourage the authors to include a more detailed analysis that allows visualizing the theoretical contribution and the contribution to science of this study, supported by a more rigorous, updated and expanded theoretical framework.
