Potential competing interests: No potential competing interests to declare.

This study is interesting for the subject matter. In fact, the use of new technologies in favor of people with disabilities is at the center of contemporary research, especially with regard to learning difficulties. However, as an experimental study, I suggest that you indicate the reference sample more precisely and the methodology used also for the selection of the articles, select more recent literature that also takes into consideration post-pandemic scenarios and give greater prominence to the technologies or applications used in the field, broadening the discussions and perhaps opening new avenues in current research.
