Potential competing interests: No potential competing interests to declare.

Consider the fact that the respected authors probably have their own religious experience. Perhaps the authors also have a near-death experience, which prompted them to study the near-death experience. If this is so, then the stated results can be fully trusted. In any case, I am grateful to the authors for the article.

The authors analysed more than 4,000 death certificates sufficient to obtain reliable facts, which causes respect for the analysis itself.

The presence of death certificates lends credibility to each record.

A graphical display of the ratio obtained during data analysis is visual.

It would be worthwhile for the authors to detail some observations in the conclusions.

The analyzed evidence can be explained from the standpoint of quantum theory. In future observations, it is desirable to refer to the work "Quantum Psychology" (author Robert Wilson), as well as to the ideas of quantum psychology expressed by Stuart Hameroff and physicist Roger Penrose "Neurocomputer Model of Consciousness" (Hameroff and Penrose, 1994).

The article is worth publishing and supporting the authors, as the quantitative indicators presented are compelling and warrant further discussion and analysis of the evidence.
