# Dermatofibrosarcoma Protuberans

National Cancer Institute

## Source

National Cancer Institute. *Dermatofibrosarcoma Protuberans*. NCI Thesaurus. Code C4683.

A low grade fibroblastic neoplasm presenting as a nodular cutaneous mass, most often on the trunk and the proximal extremities. The tumor diffusely infiltrates the dermis and the subcutaneous tissues. It is considered a locally aggressive neoplasm, which often recurs but rarely metastasizes.
