This is my review on "The Assessment of Anxiety Levels in Undergraduate Medical Students and The Determination of Various Coping Mechanisms Used".

Introduction is interesting but needs linguistic refinement. Materials and methods are described in full details. Consent was received from both student/participant and academic administrator. Has an ethical committee evaluated the consent form and the methods of administration? In statistics authors should mention the internal consistency of the questionnaire (Cronbach's  $\alpha$ ). Results lack of one or two graphs-figures which could make your manuscript easier to read. Discussion is supported by the results and is interesting.

English revisions should be made through the whole manuscript.
