Potential competing interests: No potential competing interests to declare.

The objective of the research paper is slightly ambiguous and need to be enhanced. The purpose is to understand the perception of crime in Indian neighborhoods in respect to built- environment features where CPTED is just used as a tool kit. However, CPTED is highlighted little more in the introduction itself. In literature, various built environment features and how they deal with crime can be discussed in detail. CPTED mentioned features also can be discussed. Authors directly jump into methodology without giving any idea on the quantum of studies done in this area. The methodology, discussion and conclusion part are all mixed up. They need to be clearly separated. And overall, the result and discussion part need to be elaborated. It is too brief in nature and does not explain the result much.

The topic has a lot of scope in Indian context and if enhanced can contribute to the research field immensely.
