I read this report. The problem with this work is not validity and accuracy of the formulas or the result in the figure 1 (the only result) but it is about the level of the work.

The work is not a research paper but it is a case study at the level of a postgraduate course work.

A concise literature survey is essential at the introduction for reader to compare this work with already existing ones. And to realize what is the improvement of this work in the field and showing what is the importance of the work?

The references are too old.

The paper cannot be regarded as research paper and not qualified for publication.
