HPGD wt Allele

National Cancer Institute

Source

National Cancer Institute. *HPGD wt Allele*. NCI Thesaurus. Code C78138.

Human HPGD wild-type allele is located within 4q34-q35 and is approximately 32 kb in length. This allele, which encodes 15-hydroxyprostaglandin dehydrogenase [NAD+] protein, plays a role in the regulation of prostaglandin metabolism. Mutation of the gene is associated with primary hypertrophic osteoarthopathy autosomal recessive and craniosteoarthopathy.
