This article is interesting. However, there are a few elements to be considered.

1. When you read the title, you expect to read about real data and factors that might compromise the trust in well-established vaccines, while in the text of the article you read about side effects of Covid-19 vaccines.

2. It would be interesting to specify which vaccines are compromised by the hesitancy (childhood vaccines, vaccines for HCP, adult's vaccines?)

3. Maybe a few more articles studying this phenomenon might be considered for discussion in this opinion article.
