Potential competing interests: No potential competing interests to declare.

The present manuscript is a report of a diagnosed case involving TNBC and its treatment process. The authors provide all relevant information, including examination and treatment, as well as blood and urine tests, starting from diagnosis (August 2022) up to the findings after treatment with glucosodiene (August 2023).

There are several points that should be considered: 1. The text needs major English revision, especially in the Discussion section. There are several grammar/syntax/typo errors, as well as scientific errors. 2. More references are needed to support the observations. 3. Although the basis of the treatment is the Warburg effect, no substantial explanation is provided.
