The paper is very relevant because drug consumption is a problem that is growing in Bangladesh, about drug consumption in general and specifically Yaba (a combination of methamphetamine and caffeine), and the one that is coming, crystal meth. Nevertheless, the authors need to improve this manuscript. The introduction needs more data from different sources, such as government, international health organizations, more research papers, etc. The methodology must be a systematic scoping review, for example. Then, a section with conclusions to reinforce that crystal meth is "just in the door" of the country.
