The article '[Ethnobotanical Documentation of Yerba Mate in Syria](#)' is quite interesting and much improved from the earlier version. The potential use of Yerba Mate should be placed in the introduction part, as the main focus of this study is the survey on it. Moreover, the full form of *E. coli* should be elaborated at its first appearance in the manuscript. The 28th question is talking about the side effects of consuming it, where 22.2% of participants had experienced it. But it's not specified what the potential side effects associated with it are. These portions need attention.
