Potential competing interests: No potential competing interests to declare.

It is a good scientific article for its research topic. However, if the theoretical part is OK, the research development doesn't respect the general path of writing a scientific article. I mean, there is not a clear delimitation between literature review, research methodology, study case, discussions, and conclusions. It leaves the impression that there is only a collection of statistical data from different databases.

The authors should mention what research methods have been used, what software, the analysis itself, and data interpretation.

Chapters 2, 3, 4, and 5 could be included in the literature review. What about the proof of research itself? Research methodology, study case, and discussions are missing.
