

# Review of: "Hepatoprotective Effect of the Ursolic Acid-Oleanolic Acid Mixture Administered Intragastrically in Mice with Liver Damage Induced by Anti-TB Drugs"

Ricardo Tabach

Potential competing interests: No potential competing interests to declare.

- 1) The introduction should be revised as some parts are repeated.
- 2) What were the criteria for choosing the 10mg and 20mg/kg doses of UA/OA?
- 3) Figure 1 is confusing as the curves overlap. In addition, there are indications with the letter "a" at 20 days and 50 days which have not been explained by the author. The identification of the groups in Figure 1 needs to be revised, as Group V has not been identified.
- 4) I suggest drawing up a table with the numerical data in Figure 1 to facilitate data analysis.
- 5) Table 3 is incomplete. What parameters were used to assess splenomegaly? The data are inconsistent with that presented in Table 1.
- 6) In Figure 2, I suggest adding arrows in the histological figures indicating the alterations.
- 7) The discussion is superficial and does not address the possible mechanisms of action of the mixture used.

The manuscript is not suitable for publication.
