Acetylcholine Chloride

National Cancer Institute

Source

National Cancer Institute. *Acetylcholine Chloride*. NCI Thesaurus. Code C47382.

The chloride salt form of acetylcholine, a synthetic, quaternary amino alcohol with cholinergic properties. Acetylcholine chloride mimics the parasympathomimetic effect of the endogenous compound acetylcholine. Administered as an ophthalmic solution, this drug stimulates the cholinceptors in the sphincter muscle of the iris, causing the pupil to constrict. (NCI05)
