Potential competing interests: No potential competing interests to declare.

thank you for inviting me to review this paper. this paper has serious concerns.

1. I feel there was a methodological error in this study from the very beginning.
2. The abstract section didn't state the study setting, study design, and population.
3. The sample size is too small. it is difficult to make inferences with this result to the population. Estimating prevalence with this too-small sample size is not acceptable
4. The way results were interpreted is not scientific P- P-values do not indicate the degree of association (risk) rather odds ratio better show better expresses the degree of risk.
5. The independent variables are too few and are not adequate to assess other factors at large.
6. I doubt whether the researchers in the health care and medical setting clearly understood this write-up. because the format it followed, and the methodologies are not consistent with what the topic of this research needs.
7. Overall, I am not satisfied with the paper, and I had better decline from my side.
