Review of: "Advancing Personal Health Data Spaces: Governance, Interoperability, and Real-World Evidence for Learning Healthcare Systems"

Ziyuan Guan[1]

1. University of Florida, United States

The manuscript offers a timely, high-level vision of Personal Health Data Spaces (PHDS) that will be useful for policymakers and researchers seeking a big-picture view of patient-centred data ecosystems. However, the work remains largely descriptive: key methodological, validation, and differentiation claims are under-supported, and the presentation suffers from readability issues. With targeted revisions that add concrete methods, empirical grounding, and clearer comparisons, the paper could move from a useful perspective to an actionable framework suitable for systems-oriented venues.
