Hello dear everyone.

the article "Untraveling the phytochemical and pharmacognosy contour of Traditional Medicinal plant: Pterocarpus marsupium Roxb" is a very good contribution to the promotion of medicinal plants.

basically his contribution is very original and the work carried out is more scientific. However, in the phytochemical constituents section, I would have liked the authors to highlight as many structures as possible of the compounds isolated from P. marsupium Roxb because as presented, the structuring of the document has a particularly biological orientation. To this end it would be interesting to support pharmacological work with the structures of the molecules contained in P. marsupium Roxb.

apart from this minor remark, this in no way detracts from the quality of the document and in my opinion following this small correction may be published.
