The paper speaks about a basic question in recognition and brain simulation field. It's not a new concept and the proposed approach is basically very similar to approaches in machine learning field. Identifying and selecting the best features for describing the problem is crucial task in machine learning problem. Actually, solving this concern can be very good step in recognition problems. Fortunately, the deep learning structures bypassed this step and can extract the features itself as a neuromorphic structure which would do. Also debating on this problem is so valuable but I think the paper does not show an applicable approach for the problem.
