

Review of: "Thermal Comfort Temperature Evaluation in Hospital Wards for Patient Safety and Climate Change Sustainability"

Bailing Zhou

Potential competing interests: No potential competing interests to declare.

Overall, this article did not meet the requirements for publication. The main recommendations are as follows:

1. what is the concept of thermal comfort? What is its theoretical basis?
- 2, What is thermal comfort temperature? What is its theoretical basis? What is its calculation formula? What are the influencing factors?

The above two points are not clear and the theoretical basis of the article is insufficient.

In addition, why was June 10 chosen as the analysis time? Moreover, the whole research process is not clear and the research flow chart is not being presented. What is the software for the sensitivity analysis and what is its version number? These questions are not accounted for clearly and the reader cannot reproduce the research process of the article.

Finally, the English of this article needs to be improved.
