The subject of this article is very relevant and needs to be explored in depth from various fields of knowledge, as the use of artificial intelligence will bring about significant changes, which is why its study is of vital importance. But the approach taken in this article raises a number of doubts. The first is the lack of a state of the art as well as a theoretical framework that defines the main concepts that the article addresses. Although there is a section on method, this is not intended to explain the method by which the proposed method of cultural preservation is to be used, but only to describe it. I think it would be vitally important to explain how this method that is presented achieves the goal of cultural preservation. There are many ideas that are not supported by studies and therefore appear to be opinionated. I think the article still needs to be worked on but it deserves since the subject is really interesting.
