

Review of: "Immediate test-retest reliabilities of intention to quit smoking measures in current adult smokers"

Masoud Mohammadnezhad

Potential competing interests: No potential competing interests to declare.

This is a good study.

there are three comments that should be addressed.

1. Why majority of participants are choosing form age over 36 for this study? By considering the fact that majority of smokers are under 25 years it might affect the study results.
2. What were the study inclusion and exclusion criteria?
3. please write about ethical aspects of this study.
4. Why two other stage of SOC including, action and maintenance are excluded form this study?
5. Please provide reference where you talk about the definition of smokers (who had smoked more than 100 cigarettes in their lifetime).
6. It is better to use correct reference format like 21-27 instead of writing all the continued references.
7. I believe many categories in Table 2can be combined. For example the income groups or marital status. What is difference between divorced and legally separated?
8. There are some other limitations that should be written in the relevant section
