LIST OF REVIEW

Abstract. The abstract does not yet explain the method/analytic tool used

Introduction

1. Motivation is not clear. Lack of clarity in explaining motivation, including explaining with accurate figures.
2. No clear identification of research objectives

Research Design

Demonstration of the sample selection procedure & distribution lacks clarity. This is because the sample for the study could be a cause for concern.

I would also suggest that the authors include a few sentences to clarify whether the sample size is considered reasonable to achieve an appropriate degree of statistical power and validity.

Conclusion

An additional discussion could include an evaluation of whether the results have answered the main research questions and addressed the gap in the literature.

The implication of this research should be specific and clear
