Thank you for the opportunity to review this article. In my opinion, the topic is important especially for medical students, however, the novelty of the research and the variables selected is insufficient. A large number of previous studies have verified the relationship between coping style and anxiety. What is the necessity of this study? What's new point?

Additionally, there are some defects in the methods and results, which might lead to unreliable conclusions.

The reliability of two questionnaires used was not reported.

Data were missed to robustly support the results, and therefore, the conclusions could not be drawn.
