It is an interesting and timely topic to investigate the mental health problems in college students. However, there are a few issues to note:

The age group other than 18-29 years old only had several participants. I would suggest only report results from the main age group 18-29 years old.

Similarly, there were only a number of male participants, which made it really hard to interpret the gender differences. I would suggest not focus on gender differences.

I would hope there can be some additional data or variables that can help us explain the prevalence of mental health problems during the pandemic. The results mentioned the possible correlations with income. However, the study did not report any of the correlations.

The manuscript needs to be proofread. There are grammatical errors.
