**Potential competing interests:** No potential competing interests to declare.

The present work shows an interesting advance in the analysis of the thermal environment in buildings. The structure is clear, and the results are valuable and easy to understand. The writing is correct.

The abstract shows the important aspects of the research; however, it would increase the clarity of the analysis to include numerical or more specific results of the study to establish a starting point for the following researchers.

The introduction is of correct length and has sufficient references to understand the starting point of the literature.

The methodology is clear, and the diagrams help to follow the work.

The results are well structured and well defended.

In the conclusions, the clarity and the defense of the achievement of the established objectives would increase by including the results obtained in a more specific and clear way. There are interesting intermediate numerical results that are not indicated in the conclusions and may be of interest to the scientific community.

In general, the work is adequate and interesting.
