X-linked central congenital hypothyroidism with late-onset testicular enlargement

INSERM

Source

INSERM. (1999). *Orphanet: an online rare disease and orphan drug data base. X-linked central congenital hypothyroidism with late-onset testicular enlargement. ORPHA:329235*

X-linked central congenital hypothyroidism with late-onset testicular enlargement is a rare, genetic, endocrine disease characterized by central hypothyroidism, testis enlargement in adolescence resulting in adult macroorchidism, delayed pubertal testosterone rise with a subsequent delayed pubertal growth spurt, small thyroid gland, and variable prolactin and growth hormone deficiency.
