Hypoinsulinemic hypoglycemia and body hemihypertrophy. ORPHA:293964

Hypoinsulinemic hypoglycemia and body hemihypertrophy is a rare, genetic, endocrine disease characterized by neonatal macrosomia, asymmetrical overgrowth (typically manifesting as left-sided hemihypertrophy) and recurrent, severe hypoinsulinemic (or hypoketotic hypo-fatty-acidemic) hypoglycemia in infancy, which results in episodes of reduced consciousness and seizures.
