Potential competing interests: No potential competing interests to declare.

This article presents a good topic that handles new trends and e-skills related to academic settings as well as one major challenge that comes with recent technological trends and digital maturity and systems usage.

The introduction is too long, where some paragraphs can be integrated in the Lit. Rev. section to keep the focus on the rationality of this research.

The population in which each instrument was applied is not clear, a description of the population and sampling methods need to be explicitly and clearly defined and described.

Categorization in tables 4-9 are not correct, use the words, High and medium instead.

The results related mainly support digital resilience predictors, however I fail to capture how questions No. 2 and 3 are answered, the data presented does not argue or explain the relationships or correlations between the variables.
