## Evaluation report of the draft article:

### **"Larache's Coastal in Morocco: Evaluating Dredging's Impact**

### **on Fisheries and Shoreline evolution »**

The subject focuses on the effect of dredging in the coastal areas of Larache in Morocco on both the environment and aquatic resources. The subject is very important, but the methodology followed does not adequately meet the intended objective.

Therefore, no details on the extent and history of dredging are provided. The analysis of the effect of dredging on aquatic resources is very superficial, based on the analysis of the evaluation of fishing production, which does not at all constitute an index of abundance.

The results found are very doubtful and can raise several hypotheses not necessarily related to the dredging of the coastal zone.

I do not propose the publication of this article in its current form.

You find my remarks on the manuscript.
