Dear Editor in Chief,

The article is about modeling the spread of COVID-19. The content is entirely new, credible, and suitable for citation and use, and it is emphasized for publication. We ask the authors to respond to the following question:

What are the advantages of using the Atangana-Baleanu fractional method? Why has this approach been adopted? Can other fractional methods, such as the **Caputo**, be utilized? Is it possible to make comparisons between these methods?
