# CLIPPERS

INSERM

## Source

INSERM. (1999). *Orphanet: an online rare disease and orphan drug data base*. CLIPPERS.

ORPHA:284448

CLIPPERS is a rare neuroinflammatory disorder characterized by brainstem-predominant encephalomyelitis which typically presents with cerebellar and cranial nerve manifestations (gait ataxia, dysarthria, visual disorders, parasthesias), as well as brainstem, myelopathy and cognitive findings, that respond to steroid treatment. Punctate curvilinear post-gadolinium contrast enhancement predominantly in the pons and cerebellum is observed on brain MRI and prominent, perivascular, CD3+ T-cell predominantly lymphocytic inflammation in neuropathology.
