Potential competing interests: No potential competing interests to declare.

This paper requires empirical research, and the author should refine the data analysis to support the main arguments presented.

For instance, in the section of "Commercial and strategic dimensions" the authors suggest that "Establishing an appropriate AI infrastructure may be time-consuming and costly for most firms, but there are ways to minimize the overall amount of resources to be invested in order to get things working well" This is an assumption and empirical analysis by the authors, who should have given more in-depth data analysis and empirical evidence.
