Potential competing interests: No potential competing interests to declare.

This is a very comprehensive paper that is worth circulating in the field of Cognitive Science. Based on the differentiation of two types of knowledge about subjective experience via the proposal of two-dimension semantics, the paper proves the validity of intuition for linguistic research (or broadly Cognitive Science) in certain dimension. Basically, subject judgement is not an isolated mental phenomenon, but involves a series of dynamic mental processing or parsing, as so many neurobiological studies on the linguistic or cognitive processing revealed (Here, at least valid for Chomskian linguistic studies, and whether it is true for non-Chomskian linguistics is beyond my comments). In this case, it is observable and a reliable source for linguistic research or its neighboring fields, which echoes the (partial) idea of this paper. Along these veins, it will be a very promising research topic that we can prove "2-intensional phenomenal properties" that are non-reportable is available for public science.

Last but not least, some minor points are worthy of our attention. As for the definition of 1-intension (cf. "contingent properties" in Section 4), it seems better to make it clear in Section 4 that 1-intension covers the "contingent structural relational properties", otherwise, readers will be severely baffled why the 1-intension also denotes the (structural) relation in Section 5. Then, whether linguistic phenomena can or cannot be adequately described in terms of neurology will be another good research question that is worth exploring in current "biolinguistics paradigm" (cf. Berwick & Chomsky 2016; a.o.) With the advancement of neurobiological investigations and technologies, researchers are able to observe what we cannot in the past several decades, which will absolutely pure something new into the exploration of linguistics and/or philosophy of mind, etc.
