Potential competing interests: No potential competing interests to declare.

The paper aims to discuss an important concept. However, the structure of the research study should be developed y to contribute to the body of knowledge concerning entrepreneurship education as follow:

**Abstract:** it has no clear research gap. No direct purpose is stated to guide the study. Methodology (approach and design) are not mentioned. No research findings are also mentioned. The abstract should include these important components of research.

**Theoretical Framework:** The educational theories discussed refers to the continuum of learning theories but these theories do not indicate a theoretical underpinning to guide the path of the study. It needs further development.

**Literature Review:** The review is broad and employed a narrative approach to discuss findings. I suggest to read more about systematic literature review to be able to organize your literature into focused sections to better assess the potential scope of the LR., and to present the argument of the phenomenon under discussion in a better sequence and structure.

**Methodology:** not found, although it is mentioned in the introduction that there is a methodology section (3). I suggest reading (Creswell, 2014) to clearly identify the best research approach to conduct your study, Qualitative, Quantitative or Mixed methods.

**Findings:** the current findings are not constructed or built based on analysis of any data. Not sure if it is a part of the literature review section or how this was constructed. Qualitative or quantitative data should be collected and analyzed effectively to draw a conclusion and address a gap.

**Conclusion:** no clear contribution or implication of the study

**References:** The list of references should be updated

**Overall:** The type of the current study is not clear! Is I a content analysis research or an empirical research? the structure of the current study is not appropriate. It should be restructured to identify a research gap, purpose or research questions, methodology including approach, design, participants sampling, context, tools to collect the required data). Additionally,

the findings should be constructed as per the analysis of data collected.
