How to burp an infant- a case study on four different methods, would be more suitable title for the article

In the introduction 3rd paragraph seems to be irrelevant to this topic.

Age of the infants was not mentioned. Burping attempts after breastfeeding would have been interesting to know.

Hypothetically burping is not needed that much after breastfeeding.

Interesting and nicely presented results.

Objectivity of this research is limited. The sitting position without a rocking motion has probably been the favourite position for burping for the writer even before the study. This might make him and also the babies more relaxed when waiting for the burp in this position which decreases the tendency for vomiting.
