This work looks fine. However, it may not be having wider applications.

For example, just comparing 02 countries based on some indicators (which are not properly reviewed) may not provide proper understanding to the readers.

hence, a more exhaustive comparison among group of countries based on properly reviewed and validated indicators is required. As sustainability at the country level is not very well defined construct. A proper care must be taken while comparing the countries of different backgrounds (economy, geographical area, culture and other factors).
