Dear Editor,

I would want to express my gratitude for extending an invitation to me.

This study topic is of significant importance, as it provides valuable insights into the general population's attitudes toward vaccine development in the future. Despite the waning prevalence of the COVID-19 pandemic, it is a pivotal milestone in comprehending the general public's mindset around this subject matter.

To augment the overall quality of this paper, I emphasize some aspects that the authors should take into account to bolster the scientific significance of their research.

The title and goal of the study do not align with the findings.

How is the sample size determined?

The validation of the questionnaire should be conducted by assessing the instrument's reliability by calculating Cronbach's alpha.

Please clarify how the questionnaire is distributed, specifying whether it will be distributed in paper format or via an online platform.

The authors should address the inclusion of research limitations.

The level of unwillingness should be assessed among those who have not yet received vaccination, as opposed to those who have previously been vaccinated.
