Good study here, however the following comments should be addressed by the author:

1. Under the Abstract, the objective of the study should be joined to paragraph 1;
2. In paragraph 2 of the abstract, the number of healthcare providers interviewed and how long it took should be stated;
3. Still on the abstract, the findings should be moved to paragraph 3 and the specific environmental attributes and spatial configuration that could contribute to improved security among healthcare providers should be stated;
4. The keywords should be rearranged alphabetically;
5. All assertive statements in chapter 1 – Introduction, should be justified with relevant citations;
6. Under chapter 3- methodology, the geographical scope and population scope need be stated clearly;
7. Under chapter 4 – results and findings, the method of Data analysis need to be explained better. How were the images from the space syntax analysis analyzed?
8. Under chapter 5 – conclusion, there is need for recommendations based on the findings of the study
