

Review of: "Evaluation of the impact of the COVID-19 pandemic on nurses"

Haizhu Zhao

Potential competing interests: No potential competing interests to declare.

The authors raised the question on impacts on nurses of Covid-19 and they provide a questionnaire survey result.

Firstly, I'd like to point out that the topic of the paper was meaningful but seemed too big to discuss with depth. It'll be better when the topic is specific, ie, the psychological impact or the distressing issue.....The more specific of the topic, the content will go with more details and will more be interesting and insightful.

Secondly, statistical analyses will be more convincing if regression results are presented. The authors presented frequency and percentage, mean, standard deviation, and median values, normal distribution test, Chi-square analysis, Fisher's exact test, Mann-Whitney U test and Pearson correlation. However, much more needed to be shown beyond that.
