Potential competing interests: No potential competing interests to declare.

The article entitled "Tomatoes Unveiled: A Comprehensive Exploration from Cultivation to Culinary and Nutritional Significance" focuses on the overview of the tomato.

A number of articles have been published on the tomato, so discussing the different components of tomatoes. I don't think this is a good topic to publish.

The abstract of the manuscript is too simple; there is nothing innovative and novel in that.

In the second paragraph of the introduction, the authors have presented ten-year-old data, which is outdated.

The authors should have explored more about the bioactive compounds of tomatoes.

The health benefits, such as Heart Health, Cancer Prevention, Eye Health, Weight Management and Metabolism, and Digestive Health, have been discussed in single to two lines. The topics should have been explored more, and the same should have been followed in the processing as well.

There is no conclusion.

The manuscript is without any tables and figures.

The tablem1 seems to be a screenshot from other sources.
