The title clearly describes the research undertaking in the study. The background information in the abstract can elaborate more on *Vitex doniana* fruit. The introduction of the study clearly elaborates on the topic under investigation and its importance; however, the family name of *Vitex doniana* can be inserted. It is also advisable to not begin a sentence with an abbreviation. There are several inconsistencies and grammatical errors noted in the introduction, as well as formatting issues, e.g., 'and anti-inflammatory, among others (Rani and Sharma, 2013),' brackets for citations are inconsistent. 'It has been previously known' — sentences should not begin with the word 'It'; be specific to what you are referring to. The authors need to thoroughly go through this section and correct all inconsistencies. How is this study novel? This should be included at the end of the introduction. The problem statement should be emphasized. Findings are somewhat presented in a logical sequence, and the discussion adequately summarizes the main findings. Academic writing requires improvement throughout.
