The authors' dedication to providing a comprehensive background on this intriguing subject is noteworthy. However, I do have some reservations regarding certain aspects. Firstly, it's advisable to refrain from citing information from websites. Additionally, a more detailed discussion on the findings related to urolithin A, presented through the integration of tables and figures, would effectively convey the concepts. Moreover, separating the results from clinical trials and those stemming from studies involving animals or humans would enhance clarity. Expanding the discussion with additional paragraphs about the drug's pharmacokinetics, mechanism of action, and its potential relevance in the context of COVID-19 (if applicable) is recommended. Including a comprehensive compilation of sources pertaining to urolithin A is essential. Lastly, if the market application of urolithin A is explored, it's beneficial to mention its cost and annual consumption. I trust that these suggestions will contribute to optimizing the quality of the review.
