INSERM. (1999). Orphanet: an online rare disease and orphan drug data base.

Ependymoblastoma. ORPHA:251880

Ependymoblastoma is a rare type of primitive neuroectodermal tumor (PNET) that usually occurs in young children under the age of 2 and is histologically distinguished by the production of ependymoblastic rosettes. It is associated with an aggressive course and a poor prognosis.
