

# Review of: "Gumbel's Extreme Value Distribution for Flood Frequency Analyses of Timis River"

Bruce Kelly Silva

Potential competing interests: No potential competing interests to declare.

The article needs serious adjustments. The introduction is weak and does not answer why extreme events should be evaluated in the hydrographic basin. What is the importance of this basin? In the methodology, it is not clear whether one point or several points in the basin were considered to make this evaluation. In the results and discussion section, there are no results, but rather results and methodology. There is no conclusion or final considerations. The theoretical reference needs to be improved.
