

Review of: "Different pattern of menstrual in patients with COVID-19 infections"

Melinda Ildiko Mitranovici

Potential competing interests: The author(s) declared that no potential competing interests exist.

- 1).The Virchow triad is not described in introduction.
- 2).The criteria of diagnosis is not very relevant...
- 3).I understand that 57 patients did not received anticoagulant treatment, but all the others did. It is not clear if the increasing number of menstruation days before and after covid infection is due to infection or anticoagulant treatment.
- 4)It is unclear whether the changes are due to hormonal problems or covid infection.
- 5)It is unclear if they were vaccinated and if the vaccine had any effect on menstrual bleeding.
- 6)It is not clear if the patients went to the hospital
- 7)How they came to the conclusion that prolongation of menstruation was caused by pandemic stress. They did not assess cortisol levels in patients.
