Potential competing interests: No potential competing interests to declare.

The research about this topic might help in elderly patients' rehabilitation, which is highly recommended and necessary. Consistent modifications should be taken into account to improve the manuscript's quality:

- Title: adequate. Authors should add "protocol" or else, as a reference that this article is not accomplished yet.
- Abstract: write "older" instead of "above. Methods are written as a finished review, but the manuscript suggests that it is a protocol. Coherence should be improved.
- Introduction: Studies that show inconsistent or contradictory results, and others cited, should be referenced at the end. Are there any previous reviews that have already studied the topic?
- Methods: Is well written; only a mild review should be done to improve reader understanding of how the template and PRISMA recommendations were applied.

The effort was noticed, and it is an interesting work of research.

I would recommend **accept after minor revision**.
