Potential competing interests: No potential competing interests to declare.

The present manuscript address an underexplored topic. Notwithstanding, I would suggest some changes, in attempt to adapting it to the scientific language:

1. Introduction - the arguments presented to embase the importance of this study should be focused at the consequences of the bubbles for the infant global development. The part about malnutrition, for example, should be excluded.
2. Patient and Methods - I suggest the author to explain why he decide to depicts the burp behavior only at 5-7 months, once the colics caused by bubbles, for example, is present early in life; The choose that defines the success in burping in the first 5 minutes also should be explained; When the infants burped after 5 minutes, these burp was or was not counted in the frequency of burp? It is not clear in the manuscript.
