Potential competing interests: No potential competing interests to declare.

This study examined the complex interactions among social status variables that influence the people's psychological distress. This is one of the several studies that are focus on the mental impact of COVID-19 on the population. The study was well constructed and well written.

Hence this study was conducted during March and April-2020 i.e. during pandemic, comparing the data with before and after pandemic might be give more valuable information, since mental stress is not only because of covid.

Since the data was collected 3 years ago , adding data from recent studies could be more valuable.
